Manuscript Type:	Original Manuscript
Keywords:	Digital libraries, Digital publishing, Academic libraries, Copyright law, Open access
Abstract:	Reviews the role of copyright in digital academic and research library development in the UK over the last twenty-five years, drawing on policy documents, legislative reviews and statutes, project documentation and programme syntheses. Finds that copyright-related issues have presented challenges for the development of digital libraries. UK copyright law has been reformed as a result of consultative reviews, but the role of high-level negotiations between stakeholder representatives and the development of model and blanket licences have arguably been more effective in supporting the development of digital libraries. Despite tensions between libraries and publishers, gradual cultural change and the roles played key players such funding councils and high-level representative groups has facilitated progress. The increasing trend towards open licensing presents new roles for libraries as well as challenges and new business opportunities for publishers. Concludes it is unclear what future UK copyright and research policy will be, but it is likely that improved access to academic resources and research will continue, the roles of libraries and publishers will continue to evolve and new sources of tension and challenges will arise.

### **Introduction**

There has been a great deal of change in how academic and research libraries provide access to resources in the last twenty five years or so. A major driver for change has been digitisation and the development of digital networks. All the major stakeholder groups in digital libraries have been involved in implementing change or have been affected by it. The rate and degree of change has been greatest in developed countries, but some developments have the potential to increase access to resources in less-developed parts of the world that

have been disadvantaged by traditional scholarly publishing business models.

The United Kingdom (UK) has been an active participant in exploring the potential of digitisation, digital publishing and information and communication technologies in the context of academic and research libraries and publications. The UK is an interesting case study in the development of digital libraries. A national programme of research and development was launched in the 1990s (see below), which resulted in a range of outcomes and further initiatives that paved the way for improved access to knowledge.

Copyright is a crucial issue for libraries as almost all library services involve activities that could infringe copyright. This includes digitising collections, lending and otherwise providing access to digital resources. Libraries services are provided in agreement with copyright holders, and usually require some form of financial compensation. This is done through various means, including exceptions to copyright, licence agreements and other arrangements,

1

4  
5  
6  
7  
8  
9 such as the UK's Public Lending Right<sup>i</sup> for public libraries. Library  
10  
11 budgets not only have to cover the cost of purchase or subscriptions  
12  
13 for resources in their collections, but also the costs for other uses  
14  
15 such as copying and reformatting to meet the needs of their  
16  
17 communities.  
18  
19

20  
21  
22 In the context of academic and research libraries, traditional scholarly  
23  
24 publishing models have involved the control of intellectual property  
25  
26 by publishers. There have been tensions between intermediaries such  
27  
28 as publishers and libraries as research and education communities  
29  
30 have sought to harness the potential of information and  
31  
32 communication technologies to innovate in research and the  
33  
34 provisions of access to the outcomes of research. Progress has not  
35  
36 always been smooth because of the uncertainties of the potential  
37  
38 economic impact of innovations on businesses built on exploiting  
39  
40 intellectual property rights.

access to the results of publicly funded research. Copyright has been perceived by some stakeholders as a barrier to increasing access to these results, but it has also been used to increase sharing of this knowledge, in a controlled way, through licence agreements. A good deal of progress has been made through the negotiation of model and blanket licences, more so than through legal reform. The cultural change towards open licensing is currently providing opportunities and challenges for libraries and publishers. A major aspect of this is an increasing commitment to open access, not just to research outputs, but also research data.

The aim of this paper is to review the role of copyright in the development of digital academic and research libraries in the UK, identifying the key issues, developments and players that have made an impact on progress. A key theme that emerges is the seeming incompatibility with the core role of libraries in facilitating access to knowledge with an economic model of intellectual property rights. This paper concentrates on the UK as a case study as it involves strong national support for research and development for digital

libraries and open research, coupled with government commitment to the digital economy; strong commitment on the part of publishers for licensed use on intellectual property and lobbying groups for libraries and the research and academic communities. While scope of the paper is limited to the UK, the lessons emerging from this example are potentially relevant to other countries.

### **Research and development in digital libraries in the UK**

There has been research and development activity in digital libraries in many countries for many years<sup>ii</sup>. An interesting aspect of activity in the UK has been the national programme funded by its higher education funding councils. The 1993 *Joint Funding Councils*<sup>iii</sup> *Libraries Review Group (Follett) Report* (HEFCE, 1993 paras 48-74) reported the results of a review carried out in response to concerns about the impact on academic library services of the expansion of the HE sector, the rising costs of scholarly publication and limited library budgets. The focus of the review was how information and communication technologies could be applied to libraries and

scholarly publishing to address issues of concern. This included sharing information across UK campuses and international networks, digital publishing and the digitisation of existing resources. The so-called *Follett Report* acknowledged copyright concerns [para. 75-76] and recommended that solutions to the copyright issues should be investigated through the funding of a small practical pilot project involving higher education institutions and publishers [para. 351]. Another recommendation was that demonstrator digitisation projects, including the development of copyright management systems, should be funded [para. 361].

*The Electronic Libraries Programme*

In response to the Follett recommendations, the UK funding councils' Joint Information Systems Committee<sup>iv</sup> initiated the *Electronic Libraries* (eLib) programme. Jisc's approach was to initially fund a large number of projects under a number of strands of activity (Rusbridge, 1998). This allowed experimentation with different approaches to the similar issues in the creation, storage and delivery of digital books, journals, images, pre-prints and on-demand

1  
2  
3  
4  
5  
6  
7  
8  
9 publishing (Whitelaw and Joy, 2000). Jisc commissioned evaluations  
10  
11 of each phase of the eLib programme (Whitelaw and Joy 2000,  
12  
13 2001). These evaluations and the Tavistock Institute's synthesis of  
14  
15 the 1997 eLib project annual reports highlighted the difficulties faced  
16  
17 by the on demand publishing and electronic reserve projects in  
18  
19 "overcoming the myriad difficulties connected with copyright  
20  
21 clearance, protection and charges" (Tavistock Institute, 1999: p. 9).  
22  
23  
24  
25  
26

27  
28 Two successful eLib projects in this context were Academic COurse  
29  
30 Readings via Networks (ACORN) and Scottish On-demand Publishing  
31  
32 Enterprise (SCOPE). A key element of Project ACORN was the  
33  
34 emphasis on good relations with academics and publishers (Gadd and  
35  
36 Kingston, 1998: pp.3-4). The 1997 Tavistock made the following  
37  
38 comment on project-publisher relations:  
39  
40  
41  
42  
43

44 ... the lack of an adequate mechanism or procedure to support  
45  
46 effective dialogue with publishers as stakeholders. There were  
47  
48 notable exceptions here (ACORN for example, which set up a  
49  
50 Participating Publishers Seminar) but our impression from reading

the annual reports is that most projects dealt with publishers on an individual, case by case basis, rather than engaging with them as part of a broad process of dialogue (Tavistock Institute, 1999: p. II, 3).

While ACORN’s participating publishers did not view the provision of electronic journal articles to undergraduate students as a serious potential threat to their businesses, an important aspect of the publishers seminar was they were able to voice their concerns over issues such as access and security mechanisms (Gadd and Kingston,: p. 9) and the project team were able to provide reassurances. Another feature of Project ACORN that contributed to its success was a partnership with a trusted intermediary, Swets & Zeitlinger BV. The ACORN project team was responsible for developing a process for negotiating and managing copyright clearances. Swets provided publisher contact details and allowed the project to include the company logo in permission request letters to publishers. Swets also directly facilitated some of the clearances and undertook scanning of journal articles for the

1  
2  
3  
4  
5  
6  
7  
8  
9 electronic reserve service as most publishers were unable to  
10  
11 provide digital copies (Gadd and Kingston, 1998: pp. 8-10).  
12  
13

14  
15  
16  
17 The SCOPE project tackled the more contentious activity of a  
18  
19 publishing on-demand service. As with ACORN, SCOPE aimed to  
20  
21 provide a service for undergraduate students. In SCOPE's case, this  
22  
23 effectively involved printed and electronic course packs provided on  
24  
25 demand from a resource bank of digitised short extracts (Pickering  
26  
27 and McMenemy, 1999). The project was undertaken under the  
28  
29 aegis of the Scottish Consortium of Research Libraries (SCURL) and  
30  
31 the aim was to deliver material to students in member institutions.  
32  
33 Unlike the ACORN project, which asked for permission to use  
34  
35 publishers' material without payment, the SCOPE project developed  
36  
37 a mechanism for royalty payments. Another feature of SCOPE was  
38  
39 the development of model licences for publishers. Publishers  
40  
41 differed in their views on appropriate models for calculating  
42  
43 payments, including appropriate page rates and flat fees (Pickering  
44  
45 and McMenemy, 1999: p. 215). It was up to academics and  
46  
47 publishers to agree fees. These were sometimes successfully

negotiated and sometimes the academics decided not to include material if they thought expected fee was too high. As with ACORN, publishers were wary of online delivery of their material, but were also reassured by the project team on security and access (Pickering and McMenemy, 1999: p. 219).

The first e-Lib programme evaluation included a conclusion that was true of the ACORN and SCOPE projects:

... eLib projects have helped stimulate many companies within the publishing industry into taking positions on electronic information and into addressing and clarifying their perspectives on intellectual property rights, and on charging structures. (Tavistock Institute, 1999: p. II, 7).

A key conclusion from the initial phases of the eLib programme was that a centralised copyright clearance operation would facilitate the development of digital services. The SCOPE project team was

1  
2  
3  
4  
5  
6  
7  
8  
9 successful in its bid for funding to run the Higher Education Resources  
10  
11 On Demand (HERON) service. HERON's aim was to streamline rights  
12  
13 clearance and digitisation through the development of processes and  
14  
15 software (McRory and Curry, 2000). The eLib programme manager  
16  
17 (Rusbridge, 2001), commented that HERON was:  
18  
19

20  
21  
22 ... a great project battling against very difficult conditions to  
23  
24 provide a valuable service to HEIs and to publishers. Membership  
25  
26 is growing rapidly, as is usage amongst members. This is a  
27  
28 genuine case where, after much hard work and many drafts of  
29  
30 business models, a business strategy may have been identified.  
31  
32 The important thing here is to devise sustainable ways that  
33  
34 copyright material can be used with clear, known and reasonable  
35  
36 costs, and at short notice.  
37  
38  
39  
40  
41  
42  
43

44 This comment reflects Jisc's role in the development of digital  
45  
46 academic libraries: providing funding to explore issues and develop  
47  
48 demonstrators, then withdrawing with the expectation that a  
49  
50 continuing service would have to find a viable business model.

HERON was able to use of the Copyright Licensing Agency’s Rapid Clearance Service (CLARCS) digitisation licence, which was introduced in 1999. The CLARCS licence was a transactional, rather than a blanket licence. However, clearing house services, such as CLARCS, could potentially ease the administrative burden of clearing rights. The nascent services did always run smoothly as Gadd (2001) found in her study of copyright clearance in UK libraries. It was clear from responses from libraries that they had received an inconsistent level of service from CLARCS (Gadd 2001 pp. 20-21) in terms of speed and helpfulness of staff. One of the qualitative responses on the HERON service was telling with regard to the costs of clearing rights. The respondent was “aware that using HERON is important to Higher Education Institutions ... it gives us a stronger negotiating position to lower fees.” (p. 21).

Secker and Morrison (2016, pp. 53-55) have described the unpopularity of the transactional approach to copyright clearance in the UK HEI sector and subsequent demise of CLARCS as a service for this sector. Universities UK and GuildHE negotiated the inclusion of

1  
2  
3  
4  
5  
6  
7  
8  
9 digitisation in the CLA's blanket licence. Aspects of the licence have  
10  
11 been re-negotiated to reduce cost and reporting burdens on the  
12  
13 sector (Copyright Licensing Agency 2016).  
14  
15

16  
17  
18 When its Jisc funding came to an end, HERON became a commercial  
19  
20 service run by the publishing technology companies, Ingenta and  
21  
22 then Publishing Technology Ltd. HERON continued as commercial  
23  
24 service until the end of 2016 when the Copyright Licensing Agency  
25  
26 (CLA) took over its service and then developed its Digital Content  
27  
28 Store service for educational institutions.<sup>v</sup> The cottage industry of  
29  
30 copyright clearance for creation and use of digital library materials  
31  
32 has moved to the mainstream and rights holders through their  
33  
34 collecting agencies have developed solutions to meet the needs of  
35  
36 library customers.  
37  
38  
39  
40  
41  
42  
43  
44

45 While progress was being made on digitisation, another issue was  
46  
47 emerging. Jisc did not withdraw completely from supporting digital  
48  
49 library developments, funding studies of copyright and preservation  
50  
51 and further developing model licences to meet the needs of digital  
52  
53  
54  
55  
56  
57  
58  
59  
60

libraries and their users<sup>vi</sup>. The CURL Exemplars in Digital Archives (CEDARS) eLib project identified copyright as a barrier to digital preservation and produced some guidance on intellectual property rights in this context<sup>vii</sup>. Later studies put copyright issues on the international agenda and were part of a process towards legislative reform in the UK (Ayre and Muir, 2004; Besek et al., 2008). The problems included copyright exceptions that were no longer fit for purpose and inconsistent across jurisdictions, and contracts and technological protection measures over-riding preservation exceptions. The findings of Besek et al. (2008) were presented at the World Intellectual Property Organization (WIPO) International Workshop on Copyright and Preservation (2008)<sup>viii</sup>. WIPO's Standing Committee on Copyright and Related Rights then carried out a study of limitations and exceptions for libraries in 2008, which was most recently updated by Krews in 2015, but it is not clear whether any real changed has emerged as a result of WIPO deliberations on this.

The take-up of electronic journal subscriptions by academic and research libraries was helped along by the UK funding councils' 1995

Pilot Site Licence Initiative (PSLI), which later became the National Electronic Site Licence Initiative (NESLI). The NESLI licence is the basis for the current Jisc Collections model licences.<sup>ix</sup> These licences address the various issues identified by research, development and library services, including user rights, access by off-site and walk-in users of libraries persistent access to journals included in subscriptions and archiving of content.

### **Reforms of UK copyright law relevant to digital libraries**

Recent UK copyright reforms have included changes relevant to digital academic and research libraries. UK legal deposit law has also been reformed to include digital publications. The law now makes provisions for legal deposit libraries to engage in web archiving and to provide on-site access to and preserve digital legal deposit collections without infringing copyright (Legal Deposit Libraries Act 2003; The Legal Deposit Libraries (Non-Print Works) Regulations 2013). There are, however, limitations to these reforms that may not make sense to researchers. As Ballard (2013) points out, copyright material that

was once freely available on the internet is now only accessible from the premises of a legal deposit library

The Hargreaves review of the UK’s intellectual property frameworks made recommendations on exceptions to copyright that are relevant to academic and research libraries. Most of these recommendations were implemented in 2014 and included amendments to address identified shortcomings in the scope of existing copyright exceptions (Copyright, Designs and Patents Act 1988: ss. 29 & 42). Two of the changes are meant to intended to improve access for people with disabilities (Copyright, Designs and Patents Act 1988: ss. 31A and 31B). There were also recommendations for new exceptions, including for text and data analysis for non-commercial research (Copyright, Designs and Patents Act 1988: s. 29A), which applies whatever contractual agreements say to the contrary. This exception potentially allows researchers to lawfully carry out new forms of research based on large-scale analyses of material in digital library collections. However, responses to the UK government’s consultation on the Hargreaves proposals indicated that this exception is

unpopular with publishers who would prefer to only allow this activity under licence (HM Government, 2012: p. 17). There have been reports (Mounce, 2016) that, in practice, large-scale mining of scholarly literature has been hampered by technological protection measures to prevent copyright infringement, such as limiting the number of items that can be downloaded in one go, or slowing the speed at which such downloads occur. There is a mechanism to appeal against these measures being used to prevent lawful users exercising their freedoms under copyright exceptions (Copyright, Designs and Patents Act: s. 296ZEA). The Intellectual Property Office (2015) has reported that only nine complaints were made between 2003 and 2014. All of these were in regard to computer programmes and none were upheld. It remains to be seen whether the mechanism will be used in the context of text and data analysis in future. Another issue of concern has been how researchers can download content for analysis. A prominent example is Elsevier's policy that this activity should be licensed and researchers should register to access Elsevier's own application programming interface (Elsevier, 2017).

While formally published material of interest to users of academic and research libraries is increasingly available in digital form, there is still potentially useful material that could be digitised to increase its accessibility. This includes orphan works. A work is an orphan if the rights holder of the work is not known or cannot be found to ask permission to use the work. Research carried out for the Strategic Content Alliance and Collections Trust (Korn, 2009) attempted to quantify the extent of orphan works in the public sector, including universities and libraries. The report comments on the volume of orphan works of academic but little commercial value that are unused because of difficulties in tracing rights owners. The Hargreaves Review favoured a licensing solution for the use of orphan works, which is now in place (Enterprise and Regulatory Reform Act 2013; Intellectual Property Office 2016). This is more suited to commercial use of copyright works than to digitisation of library collections to improve access. The UK also now has a new copyright exception through the European Union Orphan Works Directive (2012/28/EU). The exception is much narrower in scope than the licensing scheme: it allows for certain uses of orphan works by certain types of

1  
2  
3  
4  
5  
6  
7  
8  
9 organisation for non-commercial purposes. However, this would allow  
10 non-profit academic and research libraries to preserve and/or digitise  
11 orphan works to make them more accessible.

30 It is clear that early efforts to develop digital libraries raised copyright  
31 issues for academic and research libraries and concerns among  
32 publishers and other rights holders. At a practical level, UK-based  
33 digital library projects encountered difficulties in acquiring  
34 permissions from rights holders to digitise content and to provide  
35 seamless services based on this content. Digitisation of content by  
36 projects was necessitated largely because publishers were not  
37 offering digital versions of scholarly publications at the time.  
38  
39 Publishers participating in digital library projects were interested in  
40 experimenting. There was concern that they could lose control over

their intellectual property and that their business models would be damaged. These difficulties were not limited to the UK; they were also experienced by projects and rights holders in other countries, including the EU’s digital library programme (EBLIDA, 1999).

There were tensions between publishers and libraries in the early stages of digital development, and differences of perspective on how to move forward. As far as the eLib programme was concerned, with some exceptions, efforts to engage with rights holders were limited. However, a great deal of progress has been made at a higher level. Jisc has been an influential player, funding research and development activities and working with other stakeholder groups such as the UK’s Publishers Association (PA) during the eLib programme<sup>ix</sup>.

Disputes between libraries and rights holder groups over digitisation continue to this day.<sup>x</sup> Apart from Jisc, there are several bodies in the UK that have a role in supporting the development of digital academic and research libraries. The UUK/GuildHE Copyright Working Group

(CWG)<sup>xi</sup> has negotiated copyright licences with collective licensing organisations. The CWG also advises its members on copyright issues and responds to proposals relating to copyright. Society of College, National and University Libraries' (SCONUL) strategic vision includes a national digital library and SCONUL is a member of the CWG. SCONUL and the practitioner members of the CWG are able to communicate such issues to the senior management of HEIs through this UUK/GuildHE group.

Another body that is concerned with the identifying and communicating the impact of copyright law and the need for reform is in the UK is Libraries and Archives Copyright Alliance (LACA). LACA's mission is to advocate "a fair and balanced copyright framework which respects the rights of copyright holders whilst placing equal value on the importance of users' liberties" (Libraries and Archives Copyright Alliance, 2017). LACA has academic and research library members and is an active group, running campaigns, responding to consultations, writing to policy makers and collaborating with partner groups in Europe and beyond. Most recently, LACA has focused on

copyright exceptions, orphan works and lending of digital publications (Libraries and Archives Copyright Alliance, 2017). It is hard to say what direct impact LACA has had on government and publisher policies, but it has certainly raised awareness of the impact of copyright issues on libraries.

**Another approach to licensing: the impact of the open access movement on digital libraries**

A development that has the potential to really open up access to knowledge and research is the growth of the open access movement. The negotiation of model licences over time has had a great impact on the ability of libraries to provide digital content and services. The Creative Commons family of licences (Creative Commons, 2017) is widely used for publications. It is built on copyright, but has a different approach to rights. Instead of reserving rights, the licences facilitate sharing and re-use of resources with the proviso of acknowledgement of the original authors.

1  
2  
3  
4  
5  
6  
7  
8  
9 In the UK and elsewhere, research funders (Research Councils UK,  
10 2017) and academic communities are embracing open access, not  
11 just to improve access to research outputs, but also to increase  
12 transparency in research and re-use of research data. This trend is  
13 being reinforced in the UK by the research funding councils grant  
14 conditions<sup>xii</sup> and through the Research Excellence Framework<sup>xii</sup>, a  
15 periodic evaluation exercise which has funding implications for  
16 education institutions. The impact on libraries includes the  
17 opportunity to take on new roles in providing access to knowledge,  
18 through managing institutional repositories, facilitating discovery of  
19 open access publications and advising researchers.

30  
31  
32  
33  
34  
35  
36  
37

38 This cultural shift is a challenge to commercial publishers who have  
39 been introducing various versions of open access, introducing author  
40 pays models and/or embargo periods before publication become  
41 openly accessible. It is not yet clear what the future of academic  
42 publishing models will be, but it is likely that academic and research  
43 libraries will be able to enhance their ability to facilitate access to  
44 digital content for their communities.

**Future policy on copyright and digital libraries**

The UK’s future policy making has become less certain since it started the process of withdrawing from the European Union on 29 March 2017. It is not clear how copyright policy in the UK will develop and what impact this might have on academic and research libraries. The UK government plans (Department for Exiting the European Union, 2017) to convert EU law into UK domestic law through a European Union (Withdrawal) Bill. After the UK has left the EU, parts of this body of law will undoubtedly be repealed and/or changed to meet policy goals. The key question is what those policy goals will be and whether copyright and access to academic knowledge will have any place in the UK government’s policy agenda.

The UK could change its copyright law post-Brexit, but there might be strong commercial and political reasons not to do so, at least in the short term. The UK intellectual property framework has recently been reformed with the aim making it fit for the digital economy. Trade with the European Union post-Brexit may limit the extent to which

the UK could dispense with the elements of its copyright regime that came from the EU Directives.

It may be that rights owners feel that the new economic situation will merit renewed lobbying of government to roll back recent reforms and strengthen copyright protection. However, it is not clear whether the government would be persuaded or whether it would be a priority. There is no obvious reason for funding bodies to withdraw open access mandates either, given that this is an international trend which the UK can exploit to ensure a high international profile for its academic institutions and research. As far as libraries are concerned, LACA (2016) has indicated that it will seek clarification from government officials of the impact of withdrawal from the European Union on libraries and continue to work to increase fairness in copyright.

60

There is no doubt that digital access to knowledge through academic and research libraries in the UK has greatly improved since the publication of the *Follett Report* in 1993. While there have been reforms to update the law and address issues that have arisen, it is the way that copyright law is interpreted and used by various stakeholders that is the key issue in the digital environment. The opportunities offered by digital technologies are not being fully exploited. Improvements have been largely driven by academic and research community representatives. Rights holders and their representatives have been resistant to change but have responded with digital offerings and more affordable licensing solutions when the demand has become abundantly clear.

The impetus towards open access to publications and research continues and it is not fully clear how the relative roles of intermediaries between academic knowledge and its consumers will evolve. Academic and research libraries have increased scope to provide access to and preserve academic knowledge through copyright exceptions and increasingly open content. For publishers,

1  
2  
3  
4  
5  
6  
7  
8  
9 traditional approaches to economic exploitation of intellectual  
10  
11 property in this context could become less important and provision of  
12  
13 new services around it become more prominent. For example,  
14  
15 Elsevier has acquired services such as Mendeley, the Social Science  
16  
17 Research Network and Bepress. No doubt, this is a sensible business  
18  
19 strategy, but it may result in a different form of control over the  
20  
21 research process and research outputs.  
22  
23  
24  
25  
26  
27

28  
29 It is probably reasonable to assume no change in government policy  
30  
31 on copyright, at least in the short-to-medium term. Future  
32  
33 development is more likely to be driven by the needs of research  
34  
35 communities, the desire of libraries and other services to support  
36  
37 these needs and negotiation and innovation between libraries and  
38  
39 publishers. It is unlikely that the tensions between these stakeholders  
40  
41 will lessen in future; it is more likely that it is the sources of tension  
42  
43 will change.
